Ephemeral Environments Series (CFPs):

SREday is part of a global portfolio of technology conferences and communities that also includes LLMday, DevOps Not Dead and Conf42.

Upcoming conferences:
- SREday NYC | June 6th, 2026 (Approved)
- SREday Paris | June 16th, 2026 (Approved)
- SREday London | September 24th, 2026 (Approved)
- SREday Amsterdam | November 2th, 2026 (Approved)

Past conferences:
- SREday NYC | February 26th, 2026 (Done)

The Ephemeral Environments Series Story:

Upcoming conferences:

SREday NYC | June 6th, 2026 (Approved)

Beyond Prevention: Mastering Incident Response and Post-Mortems with Ephemeral Environments

We know Ephemeral Environments (EEs) reduce unexpected errors in production, but what happens when an issue inevitably slips through? In this follow-up to “Making Life Easier for SREs with EEs”, we shift our focus from prevention to the high-pressure world of incident response and post-mortems.

This session explores how EEs can help us become faster firefighters and more effective investigators. We will walk through a Kubernetes microservice demo to experience how EEs serve as a dual-purpose tool when facing real production failures: first, as a firefighting asset to quickly reproduce and mitigate production failures eliminating the “it only breaks in production” problem; and second, as a time machine to rebuild the exact configuration and code state that triggered the failure for deep debugging and root cause analysis leading to permanent fixes. We will also touch upon common concerns, including how to manage the cost and persistence of these temporary environments in a real-world SRE workflow.

SREday Paris | June 16th, 2026 (Approved)

The Reliability Loop: Bridging Prevention and Incident Response with

Ephemeral Environments.

Unexpected production errors often come from a familiar place: shared environments that fail to accurately validate real-world conditions.

Ephemeral Environments (EEs) offer a different approach. Instead of relying on fragile, long-lived shared environments, teams can validate each change in an isolated, production-like environment that includes code, infrastructure, and configuration.

In this talk, we'll explore how EEs reduce unexpected issues in production by improving quality validation, eliminating cross-team interference, enabling safer automated testing and accelerating deployments.

But prevention is only part of the story.

We'll also touch on how the same environments can be used after an incident to reproduce failures, reconstruct system state, and support deeper root cause analysis and post-mortems.

This session focuses on how SRE teams can use an incremental and adaptable ephemeral strategy to connect prevention and incident response into a continuous reliability loop.

SREday London | September 24th, 2026 (Approved)

Ephemeral Environments in the Real World: Handling State and Complex Architectures

Ephemeral Environments (EEs) can dramatically improve reliability: they help prevent issues from reaching production, reduce shared environment failures, and enable safer debugging when incidents happen.

But what happens when we want to incorporate this strategy on complex architectures? At that point, interesting challenges start to appear: stateful systems and databases, long environment startup times, multiple dependent services, different use cases (PR validation vs release-level testing), and so on.

In this talk, we'll explore how EEs behave outside the happy path. We'll look at real architectural trade-offs and patterns, including hybrid approaches where ephemeral services interact with controlled data layers.

Rather than presenting a perfect solution, this session focuses on the decisions and compromises required to adopt EEs beyond simple use cases.

SREday Amsterdam | November 2th, 2026 (Approved)

The Cost of Ephemerality: FinOps Trade-offs for Ephemeral Environments

Ephemeral Environments (EEs) replace long-lived shared environments with on-demand, isolated infrastructure. They improve reliability and developer velocity, but they also fundamentally change how infrastructure costs behave.

If every pull request spins up its own environment, costs can quickly become unpredictable. What used to be a fixed, always-on expense turns into a dynamic system driven by engineering activity.

In this talk, we explore the FinOps implications of adopting Ephemeral Environments from an SRE perspective. Instead of focusing on specific tools or optimizations, we'll examine how teams rethink cost control when infrastructure becomes short-lived and event-driven.

We'll discuss the trade-offs between environment fidelity and cost, how lifecycle-driven infrastructure changes spending patterns, and how reducing shared environment failures can offset infrastructure growth.

This session is about understanding the cost model behind Ephemeral Environments, and how to adopt them without losing financial control.

Making Life Easier for SREs with Ephemeral Environments

SREs often work under constant pressure, dealing with incidents and operational overhead. This talk explores how ephemeral environments can help make day-to-day SRE work easier, starting small and without disruptive changes.

The Ephemeral Environments Series Story:

1. **SREday NYC | February 26th, 2026 (Done)**

- Focus: Intro, clear benefit for SREs
- Talk Title: *"Making Life Easier for SREs with Ephemeral Environments"*

2. **SREday NYC | June 6th, 2026 (Approved)**
   - Focus: Incident Response and Post-Mortems
   - Talk Title: *"Beyond Prevention: Mastering Incident Response and Post-Mortems with Ephemeral Environments"*

3. **SREday Paris | June 16th, 2026 (Approved)**
   - Focus: End-to-end reliability loop
   - Talk Title: *"The Reliability Loop: Bridging Prevention and Incident Response with Ephemeral Environments"*

4. **SREday London | September 24th, 2026 (Approved)**
   - Focus: Hard problems and real-world complexity
   - Talk Title: *"Ephemeral Environments in the Real World: Handling State and Complex Architectures"*

5. **SREday Amsterdam | November 2th, 2026 (Approved)**
   - Focus: Economic constraints and FinOps
   - Talk Title: *"The Cost of Ephemerality: FinOps Trade-offs for Ephemeral Environments"*
