SRE at Scale

How We Standardized Reliability Across 20+ Teams

Ilia Matytcin

Senior Site Reliability Engineer

SREday Warsaw 2026

About Ilia

7+

years in cloud reliability

Senior Site Reliability Engineer
Wrocław, Poland

Previously at EPAM, UBS and JAMF

Cloud and infrastructure

Azure, AWS, Kubernetes
Terraform and Pulumi

Observability

Datadog, Prometheus, OpenTelemetry

Credentials

Azure DevOps Engineer Expert
HashiCorp Terraform Associate

The coordination challenge

20+

autonomous delivery teams

01 **What does “reliable” mean?**

02 **Can we read each other’s dashboards?**

03 **Who acts when an alert fires?**

Diagnostic questions for a rollout at scale

Shared standards, clear ownership

Delivery teams own

Service objectives
Instrumentation and dashboards
Runbooks and incident response

SRE / platform enables

Reusable templates
Common conventions
Coaching and exception support

Product + engineering agree the error budget policy

The reliability framework

SLOs

Define the user experience

Dashboards

Build a shared investigation view

Alerting

Connect urgency to human action

TEAM OWNERSHIP

Error budget policy, runbooks and a reliability guild

SLOs connect user experience to decisions

ILLUSTRATIVE AVAILABILITY SLO

99.9%

of eligible requests succeed
over a rolling 30-day window

Policy agreed with product

Healthy budget
Normal delivery

Exhausted budget
Prioritize agreed reliability work

Latency example: 95% of eligible requests complete within 300 ms over 30 days

A shared dashboard reading order

01	**Service health**	User impact and SLO status
02	**Dependencies**	Where the failure propagates
03	**Business journey**	Which user outcome is affected

RED: rate, errors, duration. Add saturation for capacity.

Templates as code, a named owner, and regular pruning

Alert routing starts with the action

Illustrative routing model

PAGE	**Act now**	Urgent user impact or budget burn
TICKET	**Plan follow-up**	Action can wait for business hours
DASHBOARD	**Investigate**	Context without an immediate action

Every page needs an owner, a useful action, and a runbook

A rollout teams can adopt

01

Pilot

One willing team

02

Evidence

Show the change

03

Champions

Teams shape standards

04

Support

Code and coaching

05

Default path

New services start here

Recommended sequence. Expand when the operating model works.

Adoption depends on useful defaults

Less effort to adopt

A supported starting point that teams can adapt

Reusable code

Versioned templates fit the team’s normal review workflow.

Team champions

A community owns the standards and handles justified exceptions.

Error budgets give product and engineering a shared decision point.

Failure modes and better responses

Failure mode	Better response
Centrally assigned SLOs	Co-design with service owners and product
Big-bang migration	Pilot, learn, then expand in phases
Paging without a clear action	Review urgency, impact, owner and runbook
Dashboards without maintenance	Assign ownership and review for relevance

Risks to review during a rollout

Outcomes need a clear measurement scope

99.95%

availability achieved

Up to 40%

reduction in MTTR

Reported career outcomes from the speaker bio, not program-wide before-and-after results.

For the rollout, track

Team-owned SLO coverage
Actionable pages and on-call feedback

The Monday-morning playbook

01 **Choose one willing team**

Start with one important user journey.

02 **Define good events**

Agree the objective and its owner.

03 **Create a shared dashboard**

Make service health easy to interpret.

04 **Review every page**

Connect urgency to action and a runbook.

05 **Agree the budget policy**

Include product in the trade-off.

06 **Measure and expand**

Check outcomes and adoption together.

Warning signs during a rollout

Artifacts exist.
Ownership is missing.

01 Vanity SLOs

02 Central approval queues

03 Big-bang deadlines

04 Pages without actions

05 Dashboards without owners

Reliability at scale

Shared definitions.
Team ownership.
